

This directory contains code that generates tables and figures for the following paper:

Title: My Paper

Author: Julian Reif

Software Requirements

Stata version 15 or higher

R version 3.6.0 or higher and the following R packages: **tidyverse**, **estimatr**

- R can be downloaded for free from: <https://cloud.r-project.org/>
- R packages are free and can be installed automatically at the R prompt. For example:

```
install.packages("tidyverse")
```

If you don't wish to install R, the R portion of the analysis can be disabled (see below).

Running the Analysis

Executing the Stata script **/MyProject/analysis/scripts/0_run_all.do** will run the analysis and generate all tables and figures. Before running this script, you must make two edits to **0_run_all.do**:

1. Define a global macro, **MyProject**, that points to the parent directory of this README file
2. (Optional) Define a global macro, **RSCRIPT_PATH**, that points to your R executable

These two edits can be made on lines 21 and 22 of **0_run_all.do**. For example:

```
global MyProject "C:/Users/jdoe/MyProject"
```

```
global RSCRIPT_PATH "C:/Program Files/R/R-3.4.4/bin/x64/Rscript.exe"
```

To disable the R portion of the analysis, set the global macro **DisableR** to 1 in line 25 of **0_run_all.do**:

```
global DisableR = 1
```
